

Map with Total number of robberies reported per 100,000 people in 2013.

Total number of robberies reported per 100,000 people in 2013.

PolicyMap divided the total number of robberies that were reported in a county or place by the population count provided by the FBI and multiplied that ratio by 100,000. The place population count is an estimate from the FBI. The county population count is an estimate of the number of people served by the agencies within the county that report offenses. Data was reported to the FBI from selected places and counties by the FBI. County counts reflect the sum of all reported offenses from agencies within the county that submitted data to the FBI. The county count may not include all offenses if agencies within the county did not report or if reported figures did not comply with FBI reporting standards. Those places or counties either not reporting to the FBI or not complying with FBI reporting standards and, thus, not compiled by the FBI, are shown as having Insufficient Data in the map. PolicyMap recommends consulting the Data Directory for more information on the data.
